DETAILED ACTION

Claim Rejections - 35 USC § 101

- 1. 35 U.S.C. 101 reads as follows:
 - Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.
- 2. <u>Claims 30-44</u> are rejected under 35 U.S.C. 101 because the claimed invention is directed to non-statutory subject matter. Claim 30 comprises two portions, a truncatable unit and a cryptographic checksum. Considering a data structure to be "a physical or logical relationship among data elements, designed to support specific data manipulation functions" (IEEE Standard Dictionary of Electrical and Electronic Terms 308, 5th edition, 1993), this is considered non-functional descriptive material that does not constitute a statutory process, machine, manufacture, or composition of matter.

Claim Objections

3. <u>Claim 8</u> is objected to because of the following informalities: examiner believes that claim 8 should be dependent on claim 2, instead of claim 1, because of the introduced "media data" in claim 2. Appropriate correction is required.

Claim Rejections - 35 USC § 112

4. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Application/Control Number: 10/616,680 Page 3

Art Unit: 2136

5. <u>Claim 43</u> is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

6. Claim 43 recites the limitation "said transcoder readable header." There is insufficient antecedent basis for this limitation in the claim.

Double Patenting

7. The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. A nonstatutory obviousness-type double patenting rejection is appropriate where the conflicting claims are not identical, but at least one examined application claim is not patentably distinct from the reference claim(s) because the examined application claim is either anticipated by, or would have been obvious over, the reference claim(s). See, e.g., *In re Berg*, 140 F.3d 1428, 46 USPQ2d 1226 (Fed. Cir. 1998); *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) or 1.321(d) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent either is shown to be commonly owned with this application, or claims an invention made as a result of activities undertaken within the scope of a joint research agreement.

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

8. <u>Claims 1-44</u> are provisionally rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 1-34 of copending Application No. 10/698,784. Although the conflicting claims are not identical, they are not patentably distinct from each other because the instant application separates data into segments, computes checksums for the data segments, and combines the segments together into a packet; whereas the copending application

Art Unit: 2136

partitions data into segments, calculates a checksum for the data segments, and enables transmitting of a first checksum separately from the rest of the data packet. The bold, italicized parts above show the differences between the instant application and copending application. The difference between the two applications is that the data segments that have checksums are operated on (transmitted, encrypted, decrypted, etc.) separately from the rest of the data segments (see, for example, claim 10 of the instant application).

This is a <u>provisional</u> obviousness-type double patenting rejection because the conflicting claims have not in fact been patented.

Claim Rejections - 35 USC § 102

9. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (a) the invention was known or used by others in this country, or patented or described in a printed publication in this or a foreign country, before the invention thereof by the applicant for a patent.
- (e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.
- 10. <u>Claims 1-5, 7, 8, 11-14, 16, 17, 19-22, 30, 36, 37, and 44</u> are rejected under 35 U.S.C. 102(a/e) as being anticipated by <u>Meehan et al.</u> (U.S. Patent Pub. No. 2003/0103571).

Regarding <u>claim 1</u>, <u>Meehan et al.</u> teaches a method of ensuring integrity of data, comprising:

- Separating an amount of data into segments (fig. 1, ref. num 3 and 4);
- Computing a cryptographic checksum for a said segment (paragraph 0042); and
- Combining a segment and an associated cryptographic checksum into a data packet (fig. 1, ref. num 7).

Regarding <u>claim 2</u>, <u>Meehan et al.</u> teaches wherein said data comprises media data (paragraph 0039).

Regarding <u>claim 3</u>, <u>Meehan et al.</u> teaches wherein said data comprises secure scalably streamable data (fig. 1, ref. num 3 and 4).

Regarding <u>claim 4</u>, <u>Meehan et al.</u> teaches wherein said data is transmittable in a network (fig. 1, ref. num 7).

Regarding <u>claim 5</u>, <u>Meehan et al.</u> teaches wherein said data is stored in a storage medium (paragraph 0004).

Regarding <u>claim 7</u>, <u>Meehan et al.</u> teaches further comprising forwarding said data packet (fig. 1, ref. num 7).

Art Unit: 2136

Regarding <u>claim 8</u>, <u>Meehan et al.</u> teaches wherein said media data to be streamed comprises a plurality of said data packets (fig. 1, ref. num 3 and 4).

Regarding <u>claim 11</u>, <u>Meehan et al.</u> teaches wherein said cryptographic checksum is computed for a truncatable unit in said segment (paragraph 0003).

Regarding <u>claim 12</u>, <u>Meehan et al.</u> teaches wherein said segment comprises a plurality of said truncatable units (paragraph 0004).

Regarding <u>claims 13 and 19</u>, <u>Meehan et al.</u> teaches wherein a cryptographic checksum is computed for each of said truncatable units in said segment (paragraph 0042).

Regarding claims 14 and 20, Meehan et al. teaches wherein a first cryptographic checksum is calculated for a first truncatable unit, and wherein a second cryptographic checksum is calculated for the combination of a second truncatable unit, said first truncatable unit, and said first cryptographic checksum (paragraph 0006-0010, suggests scalability is provided across multiple computing devices with varying processing abilities, thus allowing portions of the data to be "truncated" to provide lower quality to devices with lower processing power and providing more "truncated" portions for devices with higher processing power).

Application/Control Number: 10/616,680 Page 7

Art Unit: 2136

Regarding <u>claim 16</u>, <u>Meehan et al.</u> teaches a method for providing security to a scalably streamed media signal in a network, comprising:

- Separating said streaming media signal into a plurality of truncatable units (fig. 1, ref. num 3 and 4);
- Computing a cryptographic checksum for each of said truncatable unit (paragraph 0042);
- Appending said associated cryptographic checksum onto each of said truncatable units (fig. 1, ref. num 5);
- Combining one or more of said truncatable units and associated cryptographic
 checksums into a transmittable data packet (fig. 1, ref. num 6); and
- Forwarding said data packet (fig. 1, ref. num 7).

Regarding <u>claim 21</u>, <u>Meehan et al.</u> teaches wherein the size of said truncatable units is selected to ensure the size of said data packet is transmittable in said network (page 4, table 1).

Regarding <u>claim 22</u>, <u>Meehan et al.</u> teaches wherein said associated cryptographic checksum is computed independently for its associated truncatable unit (paragraph 0042).

Regarding <u>claim 30</u>, <u>Meehan et al.</u> teaches a computer readable medium having a data packet stored therein for causing a functional change in the operation of a device, said data packet comprising:

- A plurality of truncatable units, each of said units comprising an amount of media data (fig. 1, ref. num 3 and 4); and
- A cryptographic checksum computed for each of said truncatable units (fig. 1, ref. num 5 and paragraph 0042).

Regarding <u>claim 36</u>, <u>Meehan et al.</u> teaches wherein said cryptographic checksum is computed based on one truncatable unit (paragraph 0042).

Regarding <u>claim 37</u>, <u>Meehan et al.</u> teaches wherein said cryptographic checksum is computed based on a plurality of truncatable units and associated checksums (paragraph 0042).

Regarding <u>claim 44</u>, <u>Meehan et al.</u> teaches wherein each of said truncatable units is enabled to be deleted from said transmittable packet independently of other truncatable units in said packet (paragraph 0006-0010, suggests scalability is provided across multiple computing devices with varying processing abilities, thus allowing portions of the data to be "truncated" to provide lower quality to devices with lower processing power and providing more "truncated" portions for devices with higher processing power).

Claim Rejections - 35 USC § 103

11. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 12. <u>Claims 6, 9, 10, 15, 17, 18, 23-29, 31-35, and 38-43</u> are rejected under 35 U.S.C. 103(a) as being unpatentable over <u>Meehan et al.</u> (U.S. Patent Pub. No. 2003/0103571) in view of <u>Chang et al.</u> (U.S. Patent No. 6,963,972).

Regarding <u>claims 6 and 17</u>, <u>Meehan et al.</u> teaches all the limitations of claim 1, above. However, <u>Meehan et al.</u> does not teach further comprising applying a transcoder-readable header to said data packet.

Chang et al. teaches further comprising applying a transcoder-readable header to said data packet (col. 10, lines 54-62).

It would have been obvious to one of ordinary skill in the art, at the time the invention was made, to combine further comprising applying a transcoder-readable header to said data packet, as taught by <u>Chang et al.</u>, with the method of <u>Meehan et al.</u> It would have been obvious for such modifications because the transcoder readable header enables transcoding, which allows changes in quality without having to decrypt the data.

Regarding <u>claims 9 and 23</u>, <u>Meehan et al.</u> teaches all the limitations of claim 1, above. However, <u>Meehan et al.</u> does not teach further comprising encrypting said segment and said cryptographic checksum.

<u>Chang et al.</u> teaches further comprising encrypting said segment and said cryptographic checksum (col. 4, lines 5-9).

It would have been obvious to one of ordinary skill in the art, at the time the invention was made, to combine encrypting the data, as taught by <u>Chang et al.</u>, with the method of <u>Meehan et al.</u> It would have been obvious for such modifications because encryption secures sensitive data from unauthorized viewers.

Regarding <u>claims 10, 18, and 27, Meehan et al.</u> as modified by <u>Chang et al.</u> teaches wherein said packet is enabled to be decrypted independently of other packets comprising said streamed media data (see paragraph 0042 of Meehan et al. and fig. 12 of Chang et al.).

Regarding <u>claims 15, 24, and 38, Meehan et al.</u> teaches all the limitations of claim 1, above. However, <u>Meehan et al.</u> does not teach wherein said cryptographic checksum is computed using a hash function.

Chang et al. teaches wherein said cryptographic checksum is computed using a hash function (col. 12, lines 19-35).

It would have been obvious to one of ordinary skill in the art, at the time the invention was made, to combine using a hash, as taught by <u>Chang et al.</u>, with the method of <u>Meehan et al.</u> It would have been obvious for such modifications because hashes provide tamper protection (see col. 12, lines 19-25 of Chang et al.).

Regarding <u>claim 25</u>, <u>Meehan et al.</u> teaches further comprising accessing said data packet (fig. 1, ref. num 2) and forwarding said data packet (fig. 1, ref. num 7).

Meehan et al. does not teach reading a transcoder-readable header of said data packet and deleting one or more of said truncatable units.

Chang et al. teaches reading a transcoder-readable header of said data packet (col. 10, lines 54-62) and deleting one or more of said truncatable units (col. 13, lines 28-43); and

It would have been obvious to one of ordinary skill in the art, at the time the invention was made, to combine deleting one or more of said truncatable units, as taught by Chang et al., with the method of Meehan et al. It would have been obvious for such modifications because the transcoder readable header enables transcoding, which

allows changes in quality without having to decrypt the data. Deleting units allows lower quality data to be transmitted to low-end devices.

Regarding <u>claim 26</u>, <u>Meehan et al.</u> as modified by <u>Chang et al.</u> teaches further comprising:

 Writing a new transcoder-readable header for said data packet reflecting said deleting and applying said new transcoder-readable header to said data packet (see col. 13, lines 36-43 of Chang et al.).

Regarding <u>claim 28</u>, <u>Meehan et al.</u> as modified by <u>Chang et al.</u> teaches wherein said deleting comprises transcoding said data packet (see col. 13, lines 28-43 of Chang et al.).

Regarding <u>claim 29</u>, <u>Meehan et al.</u> as modified by <u>Chang et al.</u> teaches wherein said transcoder-readable header comprises information related to the content of said data packet while leaving said truncatable units undecrypted (see col. 13, lines 28-43 of Chang et al.).

Regarding <u>claim 31</u>, <u>Meehan et al.</u> teaches all the limitations of claim 30, above. However, <u>Meehan et al.</u> does not teach wherein said data packet further comprises a transcoder readable header comprising information related to said truncatable units and said cryptographic checksums.

<u>Chang et al.</u> teaches wherein said data packet further comprises a transcoder readable header comprising information related to said truncatable units and said cryptographic checksums (col. 10, lines 54-62).

It would have been obvious to one of ordinary skill in the art, at the time the invention was made, to combine wherein said data packet further comprises a transcoder readable header comprising information related to said truncatable units and said cryptographic checksums, as taught by Chang et al., with the medium of Meehan et al. It would have been obvious for such modifications because the transcoder readable header enables transcoding, which allows changes in quality without having to decrypt the data.

Regarding <u>claim 32</u>, <u>Meehan et al.</u> as modified by <u>Chang et al.</u> teaches wherein said transcoder readable header enables transcoding said data packet (see col. 13, lines 28-43 of Chang et al.).

Regarding <u>claim 33</u>, <u>Meehan et al.</u> as modified by <u>Chang et al.</u> teaches wherein said truncatable units and said cryptographic checksums are enabled to be encrypted independently of said transcoder readable header (see paragraph 004½ of Meehan et al. and fig. 12 of Chang et al.).

Regarding <u>claim 34</u>, <u>Meehan et al.</u> as modified by <u>Chang et al.</u> teaches wherein said truncatable units and said cryptographic checksums are enabled to be decrypted independently of said transcoder readable header (see paragraph 0042 of Meehan et al. and fig. 12 of Chang et al.).

Regarding <u>claim 35</u>, <u>Meehan et al.</u> as modified by <u>Chang et al.</u> teaches wherein said transcoder readable header is enabled to be read independently of said truncatable units and said cryptographic checksums (see paragraph 0042 of Meehan et al. and fig. 12 of Chang et al.).

Regarding <u>claim 43</u>, <u>Meehan et al.</u> as modified by <u>Chang et al.</u> teaches wherein said transcoder readable header is enabled to be written independently of said truncatable units and said cryptographic checksums (see paragraph 0042 of Meehan et al. and fig. 12 of Chang et al.).

Regarding <u>claims 39-42</u>, <u>Meehan et al.</u> teaches all the limitations of claim 30, above. However, <u>Meehan et al.</u> does not teach wherein said cryptographic checksum is calculated using a message digest, message authentication code, keyed-hashing-formessage-authentication, and a digital signature function.

<u>Chang et al.</u> does not teach wherein said cryptographic checksum is calculated using a message digest, message authentication code, keyed-hashing-for-message-authentication, and a digital signature function (col. 9, lines 32-37).

It would have been obvious to one of ordinary skill in the art, at the time the invention was made, to combine calculating the checksum using a variety of different functions, as taught by <u>Chang et al.</u>, with the medium of <u>Meehan et al.</u> It would have been obvious for such modifications because hashes provide tamper protection (see col. 12, lines 19-25 of Chang et al.).

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Brandon S. Hoffman whose telephone number is 571-272-3863. The examiner can normally be reached on M-F 8:30 - 5:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Nasser G. Moazzami can be reached on 571-272-4195. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Art Unit: 2136

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
